

APIs & Tools Functionality Overview

Technical Reference Specification — OpenClaw NBA/NFL News Retrieval Prototype

I. Ingestion & Core Frameworks

OpenClaw Engine

- Central automation engine and data router for the execution pipeline.
- Manages stateful logic for processing sports insights over continuous, 8-hour loops.
- Orchestrates data transitions between raw parsing scripts and the downstream generation layer.

nba_api

- Native Python client utilizing official endpoints from stats.nba.com.
- Retrieves deterministic structured data: live scores, detailed statistics, player profiles, and season schedules.
- Requires exact string matching against structural 10-digit unique GameID records.

nflreadpy / nfl-data

- Python interface specialized in pulling clean, historical, and real-time NFL statistics.
- Extracts play-by-play data, depth charts, rosters, and schedule frames from community nflverse storage.

II. Scrapers & Web Parsing Engines

ESPN NBA NEWS API (via Apify)

- Web scraping workflow tracking breaking news stories, columns, and editorial announcements.
- Isolates narrative news reports that traditional statistical endpoints omit.

ESPN Trade Tracker + Free Agency NEWS API (via Apify)

- Dedicated parser pinpointing transactions, trade mechanics, and player movement rumors.

HoopsHype Web Parsing

- Tailored scraper targeting community rumors, salary figures, and locker-room buzz.

NFL Data Scraper (via Apify) / Sportstracker / Sportskills

- Scraping utilities capturing non-statistical NFL updates, injury declarations, and team statements.

III. Vector RAG & Communication Gateways

RAG Chatbot & LLM Engine

- Performs deep semantic vector searches over an 8-hour historical sliding window.
- Deduplicates matching stories across feeds and synthesizes text into a singular daily brief.

Meta API & WhatsApp Business API

- Manages secure delivery loops directly onto customer communication networks.
- Utilizes standardized broadcast templates to push aggregated summaries out to target users.
